The most abundant level of expression is in the paraventricular, ventromedial and arcuate nuclei of the hypothalamus, the anterodorsal and parafascicular nuclei of the thalamus and central, basomedial and medial nuclei of the amygdala. Also expressed in cerebral cortex, lateral septum, habenula and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DOMAIN: There are two conserved domains in the glycosyltransferase region: the N-terminal domain (domain A, also called GTI motif), which is probably involved in manganese coordination and substrate binding and the C-terminal domain (domain B, also called Gal/GalNAc-T motif), which is probably involved in catalytic reaction and UDP-Gal binding (By similarity).
DOMAIN: The rich B-type lectin domain binds to GalNAc and contributes to the glycopeptide specificity (By similarity).
SIMILARITY: Belongs to the glycosyltransferase family 2. GalNAc-T
                                                                                       01-0cT-2004 (Rel. 45, Created)

Patterns 1:95-99 (2002).

-!- FUNCTION: May catalyze the initial reaction in O-linked oligosaccharide biosynthesis, the transfer of an N-acetyl-D-galactosamine residue to a serine or threonine residue on the protein receptor (By similarity).

-!- CATALYTIC ACTIVITY: UDP-N-acetyl-D-galactosamine + polypeptide UDP + N-acetyl-D-galactosaminy1-polypeptide.

-!- COPACTOR: Manganese and calcium (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

Isold=Q6PB93-2; Sequence=VSP 011201;
Note=No experimental confirmation available;
Note=No experimental confirmation available;
ISSUE SPECIFICITY: Widely expressed at high level.
DOMAIN: There are two conserved domains in the glycosyltransferase region: the N-terminal domain (domain A, also called GTI motif), which is probably involved in manganese coordination and substrate binding and the C-terminal domain (domain B, also called GB1/GB1NAc-T motif), which is probably involved in catalytic reaction and UDP-GB1 binding (By similarity).
DOMAIN: The ricin B-type lectin domain binds to GB1NAc and contributes to the glycosptide specificity (By similarity).
SIMILARITY: Belongs to the glycosyltransferase family 2. GB1NAc-T -!- CATALYTIC ACTIVITY: UDP-N-acetyl-D-galactosamine + polypeptide = UDP + N-acetyl-D-galactosaminyl-polypeptide.
-!- COFACTOR: Manganese and calcium (By similarity)
-!- PATHWAY: Glycosylation
-!- SUBCELIULAR LOCATION: Type II membrane protein. Golgi; resides preferentially in the trans and medial parts of the Golgi stack. A Yuan Z., Zavolan M., Zhu Y., Zimmer A., Carninci P., Hayatsu N., Hirozane-Kishikawa T., Komo H., Nakamura M., Sakazume N., Sato K., Shiraki T., Waki K., Kawai J., Aizawa K., Arakawa T., Fukuda S., Hara A., Hashizume W., Imotani K., Ishii Y., Itoh M., Kagawa I., Miyazaki A., Sakai K., Sakai K., Sakai K., Shihata K., S acetylgalactosaminyltranseerisciorms in murine tissues determined by real-time PCR: a new view of a large family.";

Glycobiology 13:549-557(2003)

-!- FUNCTION: Catalyzes the initial reaction in O-linked oligosaccharide biosynthesis, the transfer of an N-acetyl-D-galactosamine residue to a serine or threonine residue on the protein receptor. Has a broad spectrum of substrates for peptides such as EA2, MucSAC, Mucla, Muclb. Probably involved in O-linked glycosylation of the immunoglobulin A1 (IGA1) hinge region (By PubMed=12651884; DOI=10.1093/glycob/cwg062; Young W.W. Jr., Holcomb D.R., Ten Hagen K.G., Tabak L.A.; "Expression of UDP-GalNAc:polypeptide Nroc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002) Event=Alternative splicing; Named isoforms=2; IsoId=Q6PB93-1; Sequence=Displayed; secreted form also exists. ALTERNATIVE PRODUCTS: and mouse cDNA sequences." Togayachi A., Maran synthesis, In 1941 hinge region is determined by a single enzyme, UDP-N-acetyl-alpha-D-galactosaminyltransferase 2.";

To a single enzyme, UDP-N-acetyl-alpha-D-galactosamine residue to a serine or threonine residue on the protein receptor. Has a broad spectrum of substrates for peptides such as EA2, MucJa, Muclb, Probably involved in O-linked glycosylation of the immunoglobulin Al (1941) hinge region.

C. -I. CATALYTIC ACTIVITY: UDP-N-acetyl-D-galactosamine + polypeptide =
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DOMAIN: There are two conserved domains in the glycosyltransferase region: the N-terminal domain (domain A, also called GT1 motif), which is probably involved in manganese coordination and substrate binding and the C-terminal domain (domain B, also called Gal/GalNAc-T motif), which is probably involved in catalytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PubMed=9295285;

Lectin; Manganese; Polymorphism; Signal-anchor; Transferase;
reaction and UDP-Gal binding (By similarity).
--- DOMIN: The ricin B-type lectin domain binds to GalNAc and contributes to the glycopeptide specificity (By similarity).
--- SIMILARITY: Belongs to the glycosyltransferase family 2. GalNAc-T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypelicae Nacetylgalactosaminyltransferase 2, soluble form.

Cytoplasmic (Potential).
Signal-anchor for type II membrane protein (Potential).

Catalytic subdomain A.
Catalytic subdomain B.
Ricin B-type lectin.
Not glycosylated (Probable).
By similarity.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

i Sequence 555.4 Application US/10101464A

patent No. 6768A1

i GENERAL INFORMATION:
APPLICANT: Strabala, Timothy
APPLICANT: Nieuwenhuizen, Nicolaas
APPLICANT: Mieuwenhuizen, Nicolaas
APPLICANT: APPLICANTON: and Their Use in the Modification of Plant Cell Signaling
FILES OF INVENTION: and Their Use in the Modification of Plant Cell Signaling
FILES OF INVENTION: and Their Use in the Modification of Plant Cell Signaling
FILES PRING DATE: 2002-01-10

PRIOR FILING DATE: 2000-01-11

PRIOR FILING DATE: 1999-01-01

PRIOR FILING DATE: 1999-11-01

PRIOR FILING DATE: 2000-01-11

NUMBER OF SEQ ID NOS: 999

SOCTHARRE: FastSEQ for Windows Version 4.0

SSEQ ID NO SSS

Sequence 189053, Application US/10437963

Publication No. US20040123343A1

GENERAL INPORMATION:

APPLICANT: La Rosa, Thomas J.

APPLICANT: Cao, Yongwei

APPLICANT: Cao, Yongwei

APPLICANT: Barbazuk, Brad

APPLICANT: Barbazuk, Brad

APPLICANT: Li, Ping

TITLE OF INVENTION: Rice Nucleic Acid Molecules and Other Molecules Associated With

TITLE OF INVENTION: Pland

TITLE OF INVENTION: Plands and Uses Thereof for Plant Improvement

FILE REFERENCE: 38-21(53221)B

CURRENT APPLICANTON NUMBER: US/10/437,963

CURRENT FILING DATE: 2003-05-14

NUMBER OF SEQ ID NOS: 204966
